## Ways to Reduce your Ecological Footprint in the Landscape: LESS LAWN

Before

After

If you currently have a lawn, consider the following options:

- Reduce the size of your existing lawn or eliminate it entirely depending on the needs of your family. Smaller lawns use less water, fertilizer and mowing thereby generating less pollution.
- Choose organic fertilizers and quality composts to help your lawn grow and build the soil.
- Use a manual push-mower for small lawns or try an electric mower for larger areas.
- For areas of new lawn or when replacing an existing one, choose grass mixes such as fescues or eco-mixes that require less water than traditional ryegrass.
